CONSOLIDATED REPORT

Accessibility Audit — Keyboard Evaluation

WCAG 2.2 Level AA

Home • Shared Components • Product Detail • Shopping Cart & Checkout

SCOTTS VALLEY MARKET

Prepared by: Erin Van Brunt, October 2026

Environment: Chrome on macOS; keyboard only; VoiceOver off

Method: WCAG-EM framework, manual keyboard evaluation phase

Document scope: three representative page types, three primary shared components, and checkout-entry transition. This is a targeted keyboard evaluation, not a full WCAG conformance determination.

Table of Contents

Part I — Home Page Evaluation 2

Main content, skip link, image lightbox, findings 2–9

Part II — Shared Site Components 10

Header and search; Let's Chat; footer 10–15

Part III — Product Detail Page 16

Product controls, favorite state, skip link, WCAG mapping 16–21

Part IV — Shopping Cart & Checkout Entry 22

Cart states, keyboard expansion, checkout forms 22–27

Glossary & Consolidated Finding Index 28

PART I

Home Page

Homepage content, skip-to-main operation, image lightbox and observed keyboard interactions.

SCOTTS VALLEY MARKET

Accessibility Audit - Keyboard Evaluation

Home Page — WCAG 2.2 Keyboard Results

Conformance target: WCAG 2.2 Level AA

Methodology: WCAG-EM, manual keyboard evaluation phase

Evaluation environment: macOS, Chrome, keyboard only; VoiceOver off

Prepared by: Erin Van Brunt

Evaluation period: October 2026

Document status
Final keyboard-testing record and targeted WCAG 2.2 A/AA mapping for the Home page and tested shared components. This document identifies confirmed keyboard-related WCAG results within the tested scope; it is not a complete WCAG conformance determination for the page or website.

Website: Scotts Valley Market Home Page

Keyboard evaluation coverage

- Home page main-content Tab order and activation
- Skip to Main Content behavior
- Shared header, site search, and navigation dropdowns
- Promotional/coupon image lightbox behavior
- Persistent “Let’s Chat!” widget and embedded contact form
- Shared footer navigation, map transition, email, and Privacy Policy link

Evaluation Overview

Purpose. This record documents manual keyboard testing performed on the Scotts Valley Market Home page and three recurring site components: the shared header, shared footer, and persistent “Let’s Chat!” widget. The image enlargement/lightbox used by Home-page promotional content was also evaluated because it is opened from keyboard-reachable Home-page controls.

Method. Testing was performed manually in Chrome on macOS with VoiceOver off. The evaluation used Tab and Shift+Tab for focus traversal and Enter, Space, arrow keys, and Escape where applicable. Automated tools were not used for this keyboard phase.

Interpretation. Terms such as “keyboard operable” describe the behavior directly tested in this phase. Targeted WCAG 2.2 mapping is included for keyboard-related Success Criteria supported by the collected evidence. Criteria not exercised by this keyboard phase are evaluated later in the full WCAG 2.2 A/AA coverage review.

Scope boundaries

- The transition from Scotts Valley Market to the external Instacart storefront was tested; the external Instacart product was not comprehensively audited.
- Keyboard traversal into the embedded Google Map was documented, but full Google Maps functionality was outside scope.
- The macOS file-selection dialog opened by the chat attachment control was not evaluated further.
- Targeted keyboard-related WCAG mapping is included in this report. Screen-reader semantics, DOM/accessibility-tree inspection, automated testing, and the complete WCAG 2.2 A/AA coverage matrix remain later audit phases.

Keyboard Evaluation Summary

Area	Keyboard result	Key observation
Home main content	WCAG failure confirmed	Primary links and widgets were reachable and activatable. Promotional/coupon images fail Focus Visible (2.4.7). The “We’re Hiring!” control also behaved incorrectly for both keyboard and mouse, indicating a general functionality defect rather than a keyboard-specific failure.
Skip to Main Content	Functional; WCAG failure confirmed	The skip mechanism bypassed repeated navigation, but the next focused main-content link was entirely outside the visible viewport, failing Focus Not Obscured (Minimum) (2.4.11).
Image lightbox	WCAG failures confirmed	Close/navigation controls did not respond to Enter or Space; Escape was unreliable; focus could move behind the open overlay. Failures confirmed under 2.1.1, 2.4.3, and 2.4.11.

Home Page Main Content

Normal Tab sequence

After the shared header, keyboard focus proceeded through the Home-page content in this order:

1. Red “Order your favorite Deli Sandwiches, BBQ and more online here!” promotional link
2. Rotating food/promotional image
3. Instacart logo/link
4. Coupon advertisement image #1

5. Coupon advertisement image #2
6. “We’re Hiring!” text link
7. “Let’s Chat!” launcher
8. Shopping Bag widget, when present
9. Shared footer

Focus presentation. All observed controls had a visible focus indication except the rotating promotional image and the two coupon images. When those images received focus, a filename-like string briefly appeared beneath the image, but no persistent, readily recognizable focus indicator remained visible. This behavior is mapped to WCAG 2.2 SC 2.4.7 Focus Visible (Level AA) in Section 9.

Activation behavior

Order Online promotional link

Enter navigated to the Order Online page as expected.

Rotating promotional image

Enter opened the current promotional image in an enlarged lightbox. Lightbox behavior is documented separately in Section 5.

Instacart logo/link

Enter opened the external Scotts Valley Market Instacart storefront. The external service was not audited beyond this transition.

Coupon advertisement images

Enter opened the selected coupon image in the same enlarged-image lightbox pattern used by the rotating promotional image.

“We’re Hiring!” link

Enter did not navigate to the Employment Opportunities page. Instead, the Home page scrolled to the top and the resulting focus location was not visually apparent. A follow-up mouse test produced the same scroll-to-top behavior. This is therefore documented as a general functionality defect rather than a keyboard-specific WCAG failure.

“Let’s Chat!” launcher

Enter opened the chat/contact panel. The panel is documented separately in Section 7.

Shopping Bag widget

Enter navigated to the Order Online cart page as expected.

Skip to Main Content

Availability and activation

Sequence: Refresh → Tab

The “Skip to Main Content” control became visible near the top center of the page and had a clear visible focus indicator.

Sequence: Refresh → Tab → Enter

Activating the skip link shifted the viewport into the main-content area. The red Order Online promotional link was positioned above the visible portion of the viewport, and the visible page began partway through the rotating promotional image. No focused element was immediately visible after activation.

Focus after the skip action

Sequence: Refresh → Tab → Enter → Tab

No focused element was visible in the current viewport. Manually scrolling upward revealed that the red Order Online promotional link had keyboard focus and did have a visible focus indicator.

Activation check. Pressing Enter at that point navigated to the Order Online page, confirming that the first Tab after the skip action had reached the first interactive main-content link.

WCAG result
The skip mechanism successfully bypasses repeated navigation, satisfying the tested Bypass Blocks behavior. However, after the skip action, the next focused main-content link is entirely outside the visible viewport until the user manually scrolls upward. This is a confirmed failure of WCAG 2.2 SC 2.4.11 Focus Not Obscured (Minimum), Level AA.

Promotional and Coupon Image Lightbox

This test applies to the enlarged-image interface opened from the rotating promotional image and both coupon advertisement images.

Opening and focus sequence

Each image could be reached by keyboard and opened with Enter. Once the lightbox was open, Tab moved through the visible lightbox controls in this order:

1. Close/X control
2. Right-arrow navigation control
3. Left-arrow navigation control

After the lightbox controls were passed, focus left the webpage and moved into browser chrome. When focus later returned to the webpage, it could move to content behind the still-open overlay.

Control activation

Close/X control

The control received visible focus, but neither Enter nor Space closed the lightbox.

Previous/Next controls

The arrow controls received visible focus, but neither Enter nor Space changed the displayed image.

Escape

Escape closed the lightbox in some attempts but was not reliable across testing.

WCAG result
The lightbox is a confirmed keyboard accessibility failure. Its close and navigation functionality is not reliably operable through the tested keyboard interface (SC 2.1.1 Keyboard, Level A). While the overlay remains open, focus can proceed to page content behind it, disrupting the modal interaction sequence (SC 2.4.3 Focus Order, Level A) and allowing keyboard focus to land on content obscured by the overlay (SC 2.4.11 Focus Not

Obscured (Minimum), Level AA). No keyboard trap was observed because focus can move away from the component.

Home Page — WCAG Assessment and Confirmed Findings

WCAG 2.2 Keyboard Success Criterion Results

Scope of this mapping. The table below maps the completed manual keyboard evidence to the WCAG 2.2 Level A and AA Success Criteria directly exercised by this phase. A "Pass" means no failure of that criterion was observed within the components and states tested here; it does not establish site-wide conformance or replace the later full WCAG coverage matrix.

Success Criterion	Level	Result	Evidence / rationale
2.1.1 Keyboard	A	**FAIL**	The image lightbox exposes close and previous/next controls to keyboard focus, but Enter and Space do not operate them; Escape dismissal is unreliable. The lightbox functionality is therefore not reliably available through the keyboard interface.
2.1.2 No Keyboard Trap	A	**PASS (tested scope)**	Focus could be moved away from every tested component using the keyboard. The lightbox has serious focus-management problems, but it does not trap focus.
2.4.1 Bypass Blocks	A	**PASS**	A visible "Skip to Main Content" mechanism is available from the first Tab stop and successfully bypasses the repeated header/navigation.
2.4.3 Focus Order	A	**FAIL**	While the image lightbox remains open, sequential focus can leave the overlay and later reach background page content. This interaction order does not preserve the operability of the modal/ lightbox experience.

Success Criterion	Level	Result	Evidence / rationale
2.4.7 Focus Visible	AA	**FAIL**	The rotating promotional image and both coupon images do not retain a persistent, readily recognizable visible focus indicator; only a brief filename-like text change appears.
2.4.11 Focus Not Obscured (Minimum)	AA	**FAIL**	After the skip action, the next focused main-content link is entirely outside the visible viewport. The lightbox also allows focus to reach page content obscured by the open overlay.

Confirmed WCAG Findings from Keyboard Testing

Three findings are confirmed from this keyboard phase. They are consolidated by component/root behavior rather than duplicated for each repeated instance. Severity is not assigned in this document; the audit's severity methodology can be applied during final findings review.

A11Y-001 - Image lightbox is not reliably keyboard operable and permits focus behind the open overlay

Status: Confirmed WCAG failure

Component: Home-page promotional and coupon image lightbox (same behavior across all three tested entry points)

WCAG 2.2: SC 2.1.1 Keyboard; SC 2.4.3 Focus Order; SC 2.4.11 Focus Not Obscured (Minimum)

Conformance level: Level A / AA

Evidence: Tab sequence: Close/X -> right arrow -> left arrow -> focus leaves the webpage; Enter and Space do not activate the visible lightbox controls; Escape is inconsistent; background page content can receive focus while the overlay remains open.

Description: The lightbox opens from the keyboard, but the visible Close/X and previous/next controls do not respond to Enter or Space. Escape closes the overlay only inconsistently. After the lightbox controls are passed, focus can leave the webpage and, when it returns, proceed to page content behind the still-open overlay.

User impact: Keyboard users may be unable to reliably close or navigate the enlarged-image experience and can lose track of their position when focus moves to content hidden behind the overlay.

Recommended remediation: Use native button elements for lightbox controls and ensure their keyboard activation works with standard keyboard interaction. When the lightbox opens, move focus into it; while it is modal, prevent background page content from receiving focus (for example, with a correctly implemented

native dialog/inert background pattern); support a reliable Escape close action; and return focus to the triggering image/control when the lightbox closes.

A11Y-002 - Promotional and coupon image controls do not provide a persistent visible focus indicator

Status: Confirmed WCAG failure

Component: Rotating promotional image and two coupon advertisement images on the Home page

WCAG 2.2: SC 2.4.7 Focus Visible

Conformance level: Level AA

Evidence: The same focus presentation was observed on the rotating promotional image and both coupon image controls.

Description: When keyboard focus reaches these image controls, no persistent focus outline or similarly recognizable indicator remains visible. A filename-like string appears briefly beneath the image and then disappears.

User impact: Sighted keyboard users can lose track of which image control currently has focus and may not know where Enter will act.

Recommended remediation: Provide a persistent, clearly recognizable focus style for each interactive image control for the entire time it has keyboard focus. Prefer a CSS :focus-visible treatment such as a clear outline or border that remains visible until focus moves elsewhere.

A11Y-003 - Skip-link flow leaves the next focused main-content link entirely outside the visible viewport

Status: Confirmed WCAG failure

Component: Skip to Main Content / first Home-page main-content link

WCAG 2.2: SC 2.4.11 Focus Not Obscured (Minimum)

Conformance level: Level AA

Evidence: Refresh -> Tab to Skip to Main Content -> Enter -> Tab. No focused component is visible; manually scrolling upward reveals the focused Order Online promotional link.

Description: The skip mechanism successfully bypasses the repeated header/navigation. After activation, however, the viewport is positioned so that the first main-content link reached by Tab is above the visible viewport. The link has a visible focus style, but it cannot be seen until the user manually scrolls upward.

User impact: A sighted keyboard user can press Tab and have no visible indication of the currently focused control, making navigation appear to be lost even though focus is present.

Recommended remediation: Adjust the skip target and scroll positioning so the destination and subsequent focused content remain at least partially visible. If a sticky/fixed header affects the scroll position, account for its height (for example with appropriate scroll-margin or equivalent layout behavior) and verify the result at supported viewport sizes.

PART II

Shared Site Components

Header and search; persistent Let's Chat widget; footer and embedded map. Evaluated once as reusable site-wide components.

Shared Components — Keyboard Evaluation Summary

Area	Keyboard result	Key observation
Shared header	Mostly operable	Navigation, dropdowns, and search were keyboard usable. The search clear/X control behaves differently with Enter versus Space, but Space provides keyboard operation; no keyboard WCAG failure was confirmed for that control.
Shared footer	No keyboard-operability issue observed in scoped controls	Navigation, dropdowns, email, and Privacy Policy link worked. Embedded Google Maps was documented but not comprehensively audited.
"Let's Chat!" widget	Mostly operable	Core chat and form functions worked. Emoji-picker navigation/dismissal was cumbersome; status/error controls require later semantic and assistive-technology review. No keyboard WCAG failure was confirmed from these behaviors.

Shared Header

Header Tab order

Keyboard focus moved through the visible skip link, search field, and primary navigation. About and Contact each included an additional separately focusable caret/dropdown control. After the final header control, focus proceeded into the Home-page main content. All observed header controls had a visible focus indication.

Site search

- Focusing the search field opened the suggestion panel automatically.
- With an empty search field, Up/Down Arrow moved through available options and Enter activated the selected option.
- Typing generated search suggestions; Up/Down Arrow moved through them and Enter activated the selected suggestion.
- With an empty search field, Tab exited the search normally.

- Escape closed the suggestion panel as expected.

Search clear/X control

After text was entered, Tab moved visible focus to the X/clear control. Space cleared the search field as expected. Enter did not clear the field; instead, it activated the currently selected search result and navigated to that result.

Primary navigation and dropdowns

The primary navigation links were reachable and activated with Enter as expected. Home produced no navigation because the user was already on the Home page; the other tested navigation links opened their expected destinations.

The About and Contact caret controls opened their respective dropdown menus with Enter. Tab moved through the submenu options, Enter activated focused submenu links, and after the final submenu item the normal navigation Tab sequence resumed. Arrow keys did not move among submenu items and instead scrolled the page, but no keyboard-operability issue was observed because the menus remained fully traversable and activatable using Tab and Enter in this test.

WCAG disposition
The search clear/X control has inconsistent keyboard conventions: Space clears the field, while Enter activates the selected search result. Because the clear function is available through the keyboard using Space, this behavior does not by itself establish a failure of SC 2.1.1 Keyboard. The control's semantics and event handling should still be reviewed during code/accessibility-tree testing.

Persistent "Let's Chat!" Widget

A fresh Incognito session was used so previously persisted chat state would not affect the test.

Launcher, opening, and primary controls

- The launcher received visible focus and opened with Enter.
- When the panel opened, focus began in the "Write your message…" field.
- The initial focus indication was subtle; the primary visible cue was the blinking text cursor.
- Tab order proceeded through the message field, emoji control, attachment control, and close/X control.
- Typing in the message field worked normally, and Enter sent the typed message.
- The close/X control closed the chat panel successfully with Enter.

Emoji picker

Enter on the emoji control opened an emoji library. Emoji options could be reached using Tab; arrow keys did not navigate among them. An emoji could be selected using the keyboard.

Dismissing the picker was cumbersome: reaching its close control by forward Tab required traversing a very large number of emoji options. After choosing an emoji, Shift+Tab/Tab could reach the close control more quickly. Pressing Escape while the picker was open closed the entire chat panel rather than only the emoji picker.

Attachment control

Enter on the attachment control opened the macOS file-selection dialog. The operating-system file picker was not evaluated further.

Contact form

The embedded contact form contained Name, Email, Message, and Submit. The fields were reachable in a logical Tab order, accepted text normally, and allowed focus to continue through the form and back to the main chat input area.

Small exclamation-mark status/error controls appeared next to Name and Email in certain states. These controls received keyboard focus, but Enter produced no observable action. Their purpose and semantics were not established during keyboard-only testing.

The Submit button activated successfully with Enter. After submission, the form reset to a blank state.

WCAG disposition
The chat widget's core messaging, closing, and form-submission functions were keyboard operable. The cumbersome emoji-picker traversal and Escape behavior are documented as usability concerns rather than confirmed keyboard WCAG failures. The focusable Name/Email status controls require later semantic and assistive-technology review before any additional WCAG determination.

Shared Footer

Footer navigation

Focus entered the footer navigation first. The sequence mirrored the header navigation and included separately focusable About and Contact caret controls. Focus was visibly indicated on the footer navigation controls.

The About and Contact dropdowns behaved the same way as their header equivalents: Enter opened the menu, Tab moved through submenu links, Enter activated the focused destination, and the normal footer Tab sequence resumed after the submenu. The visual presentation of the open dropdowns appeared awkward, but no keyboard-operability issue was observed.

Embedded Google Map

After the footer navigation, focus entered the embedded Google Map and passed through approximately ten keyboard-focusable controls/stops. Focus was difficult to visually track at times. Comprehensive Google Maps testing was outside the defined scope, so the interaction was documented but not evaluated further.

Footer links

The email link received visible focus and activated as expected.

The "Our Privacy Policy…" link received visible focus and opened the expected Privacy Policy PDF in a separate browser tab/window:

Scotts Valley Market Privacy Policy PDF

Shared Components — WCAG 2.2 Keyboard Success Criterion Results

Scope of this mapping. These determinations apply only to the three shared components tested (header/search, Let's Chat, footer). Home-page and commerce-page failures are assessed in their own sections, without duplicating them here.

Success Criterion	Level	Result	Evidence / rationale
2.1.1 Keyboard	A	**PASS (tested scope)**	Header navigation, search suggestions, footer links and chat messaging/form controls were operable by keyboard in the tested interactions.
2.1.2 No Keyboard Trap	A	**PASS (tested scope)**	Keyboard focus could proceed through tested header, footer, chat and map transitions; no keyboard trap observed.
2.4.1 Bypass Blocks	A	**PASS (tested behavior)**	The shared Skip to Main Content mechanism was reachable and bypassed repeated header navigation; page-specific scroll failure is assessed in Parts I and III.
2.4.3 Focus Order	A	**PASS (tested scope)**	Header and footer menus, search and chat controls followed a usable sequential focus order in tested states.
2.4.7 Focus Visible	AA	**PASS (tested controls)**	Visible keyboard focus was observed on tested shared header/footer navigation and chat launcher; subtle chat text-entry indication is noted separately; this does not cover page-specific image or purchase controls.
2.4.11 Focus Not Obscured (Minimum)	AA	**PASS (tested shared controls)**	No shared-component-specific completely obscured focused element was established; off-screen focus after skip-link use is assessed within affected page evaluations.

Other Documented Keyboard and Functionality Observations

The items below remain important remediation or follow-up notes, but the current evidence does not establish an additional keyboard WCAG failure.

Observation	Disposition	Reason / next step
Search clear/X control	Keyboard-operable; technical review recommended	Space clears the search field, while Enter activates the selected suggestion. Because the clear function is available from the keyboard, no SC 2.1.1 failure is confirmed from this behavior alone. Review element semantics and event handling later.
“We’re Hiring!” link	General functionality defect	Enter scrolls the page to the top instead of navigating to Employment Opportunities. Mouse activation produces the same result, so this is not a keyboard-specific failure. Repair the destination/activation behavior.
Chat emoji picker	Usability / best-practice concern	The picker is keyboard operable, but forward Tab requires traversing a very large emoji list to reach the close control, and Escape closes the entire chat panel rather than only the picker.
Chat Name/Email status controls	Requires semantic/AT review	The exclamation-mark controls receive focus but Enter has no observable effect. Their purpose, accessible name, role, and state were not established during keyboard-only testing.
Embedded Google Map	Outside comprehensive audit scope	Keyboard traversal into the embedded third-party map was documented, but the Google Maps product was not comprehensively evaluated.

Positive Keyboard Behaviors Observed

- A visible Skip to Main Content control is available from the first Tab stop and successfully bypasses repeated header/navigation content.
- Primary header and footer navigation links are keyboard reachable and activate as expected.
- About and Contact dropdown links can be traversed and activated using Tab and Enter.
- Search suggestions can be navigated with Up/Down Arrow and selected with Enter; Escape dismisses the suggestion panel.
- The Order Online promotional link, Instacart link, Shopping Bag control, email link, and Privacy Policy link are keyboard operable in the tested flows.

- The “Let’s Chat!” launcher, message field, close control, contact-form fields, and Submit button are keyboard operable.
- The chat contact form follows a logical Tab sequence and resets after successful submission.
- No keyboard trap was observed in the tested Home-page and shared-component interactions.

Conclusion

Overall keyboard result. The Home page and tested shared components provide broad keyboard access to navigation, links, search suggestions, chat functions, and form controls. Targeted WCAG verification confirmed three accessibility findings affecting four keyboard-related WCAG 2.2 Success Criteria: 2.1.1 Keyboard, 2.4.3 Focus Order, 2.4.7 Focus Visible, and 2.4.11 Focus Not Obscured (Minimum).

Passing results. Within the tested scope, SC 2.1.2 No Keyboard Trap and SC 2.4.1 Bypass Blocks passed. These pass results apply only to the components and states exercised in this keyboard phase and do not constitute a page- or site-wide conformance claim.

Next audit phases. Semantic/HTML review, VoiceOver testing, automated testing, DevTools/accessibility-tree investigation, and the final WCAG 2.2 A/AA coverage matrix remain necessary. Those phases may confirm additional findings or add criteria to existing findings.

Audit note. This document consolidates the evaluator’s contemporaneous keyboard-testing notes and targeted WCAG verification for the components listed above. No automated scanner output was used to generate the keyboard observations or the confirmed keyboard findings.

PART III

Product Detail Page

Grab & Go Strawberry Feta Salad — individual product controls and purchase/favorite flows.

SCOTTS VALLEY MARKET

Accessibility Audit - Keyboard Evaluation

Product Detail Page - WCAG 2.2 Keyboard Results

Conformance target: WCAG 2.2 Level AA

Methodology: WCAG-EM, manual keyboard evaluation phase

Evaluation environment: macOS, Chrome, keyboard only; VoiceOver off

Prepared by: Erin Van Brunt

Evaluation period: October 2026

Document status
Final keyboard-testing record and targeted WCAG 2.2 A/AA mapping for the selected Product Detail page. Results address only the keyboard-tested scope, not full page or website conformance.

Website: Scotts Valley Market - Grab & Go Strawberry Feta Salad

https://www.scottsvalleymarket.com/orderonline/Grab-&-Go-Strawberry-Feta-Salad-p456790817

Keyboard evaluation coverage

- Product-detail main-content Tab order and activation
- Breadcrumbs and previous/next product navigation
- Product input fields, quantity, cart and favorites interactions
- Product social sharing and shared commerce utility navigation
- Skip to Main Content focus positioning

Evaluation Overview

Purpose. This report records manual keyboard testing of the Grab & Go Strawberry Feta Salad Product Detail page, including product-specific controls, dynamic states, and the skip-link flow.

Method. Chrome on macOS, keyboard only, VoiceOver off. The initial sweep followed sequential Tab order without using Skip to Main Content. Follow-up testing used Enter, arrow keys, and text entry as appropriate. Unmentioned controls in the observed sequence were reported by the evaluator to function as expected.

Scope boundaries. The already-evaluated shared header, footer, and “Let’s Chat!” panel are excluded from detailed retesting. The five-item commerce utility navigation and floating Shopping Bag are identified as reused components; only their keyboard traversal in this page context is recorded. Automated checks, VoiceOver, semantics, and DOM inspection are reserved for later phases.

Keyboard Evaluation Summary

Area	Keyboard result	Key observation
Breadcrumbs	Operable	Store, Salads, and Grab & Go Salads appear first in the main-content Tab order.
Product navigation arrows	Operable; focus concern	Enter navigates to neighboring products; the persistent focus cue is a narrow blue vertical line that does not clearly identify the selected arrow.
Product fields and quantity	Operable	Phone and Special Instructions accept input; Quantity supports arrows and typed entry/deletion.
Cart and favorite controls	Operable; workflow note	Add More adds one item then navigates to /orderonline/cart; Favorite reveals View Favorites, which follows in Tab order.
Commerce utility navigation	Operable in tested traversal	Five-item shared commerce navigation follows social sharing; separate chat and bag widgets follow.
Skip to Main Content	Bypasses navigation; focus off-screen	After skip activation, the next Tab reaches Store while it remains outside the viewport. Recurrence of A11Y-003.

Product Detail Main Content

Normal Tab sequence

After the existing header, keyboard focus proceeded through the Product Detail page in this observed order:

- Breadcrumbs: Store → Salads → Grab & Go Salads
- Previous product arrow → Next product arrow
- Phone Number input → Special Instructions textarea → Quantity input
- Add More → Go to Checkout → Favorite
- View Favorites (only after the product is favorited)
- Social sharing: Facebook → X → Pinterest
- Commerce utility navigation: Search Products → My Account → Track Orders → Favorites → Shopping Bag
- Persistent Let's Chat launcher → floating Shopping Bag widget → shared footer

Focus indication. Most tested controls provided discernible focus indication. Exceptions flagged for closer review were the previous/next arrows (a persistent, narrow blue line) and the Add More, Go to Checkout, and Favorite buttons (brief ripple that disappears without leaving any visible focused state). Lack of an outline alone does not establish a WCAG failure.

Activation and dynamic interactions

Previous/Next product arrows. Enter activated the arrows and navigated to the corresponding products. The evaluator could not reliably tell which arrow was focused from the minimal vertical-line indicator.

Product fields. Phone Number and Special Instructions were traversable and reported to work as expected. Quantity could be increased/decreased with arrow keys; digits could also be typed and deleted.

Add More. Activation added another item to the cart and immediately navigated to /orderonline/cart. This observed workflow is recorded without identifying an accessibility defect; its intended UX behavior has not been independently established. Go to Checkout was reported to work as expected.

Favorite / View Favorites. Favoriting the product updated the control state and dynamically introduced View Favorites. Focus remained on the Favorite control; the next Tab moved to View Favorites. Enter navigated to /orderonline/account/favorites. Screen-reader announcement of the changing state was not evaluated.

Social sharing and commerce utility navigation. Facebook, X, Pinterest, and the five shared commerce links were encountered in order; no activation problems were reported in this sweep.

Skip to Main Content

The Skip to Main Content mechanism bypassed repeated navigation. However, the viewport scrolled down beyond the first product content controls. On the next Tab, keyboard focus moved correctly to Store in the breadcrumb navigation, but Store remained above the visible viewport. The evaluator confirmed that the focused element could not be seen without adjusting the scroll position.

WCAG interpretation. Bypass Blocks behavior was observed, but the subsequent off-screen focused component reproduces the Home-page focus-visibility problem already recorded as A11Y-003 (SC 2.4.11 Focus Not Obscured (Minimum), Level AA). The precise layout/scroll mechanism should be verified during technical review.

WCAG 2.2 Keyboard Success Criterion Results

Scope of this mapping. The table below maps the completed manual keyboard evidence to WCAG 2.2 Level A and AA Success Criteria directly exercised by this phase. A “Pass” means no failure was observed in the tested states; it does not establish full page or website conformance.

Success Criterion	Level	Result	Evidence / rationale
2.1.1 Keyboard	A	**PASS (tested scope)**	Product controls were keyboard reachable and operative, including arrow navigation, inputs, quantity, cart, favorites, and navigation controls.

Success Criterion	Level	Result	Evidence / rationale
2.1.2 No Keyboard Trap	A	**PASS (tested scope)**	Focus proceeded through the controls to later content and reusable components; no trap was observed.
2.4.1 Bypass Blocks	A	**PASS (tested behavior)**	Skip to Main Content bypassed repeated site navigation and positioned subsequent focus in product content.
2.4.3 Focus Order	A	**PASS (tested scope)**	Sequential order was logical; newly created View Favorites followed Favorite on the next Tab.
2.4.7 Focus Visible	AA	**FAIL**	Product arrows show a persistent narrow blue line; Add More, Go to Checkout, and Favorite show subtle focus changes. The transient button ripple disappears while keyboard focus remains; no persistent indicator is visible. The narrow arrow indicator remains separately documented.
2.4.11 Focus Not Obscured (Minimum)	AA	**FAIL**	After skip-link activation, the next focused Store breadcrumb is entirely outside the visible viewport (recurrence of A11Y-003).

Confirmed WCAG Findings from Keyboard Testing

A11Y-003 - Skip-link flow leaves the next main-content focus off-screen

Status: Confirmed recurring keyboard finding (previously documented on Home)

Component: Skip to Main Content / first Product Detail breadcrumb (Store)

WCAG 2.2: SC 2.4.11 Focus Not Obscured (Minimum), Level AA

Evidence / reproduction: Refresh → Tab to Skip to Main Content → Enter → Tab. The next focus reaches Store, but the browser viewport has moved below it and does not display the focused breadcrumb.

User impact: A sighted keyboard user can lose their visual place immediately after using a mechanism intended to simplify navigation.

Recommended remediation: Adjust skip-target focus and scroll positioning so the next focused main-content control remains visible. Investigate scroll behavior and any fixed/sticky layout offsets, then retest at supported viewport sizes.

Other Observations Requiring Review

Observation	Disposition	Reason / next step
Previous/Next arrows	Focus visibility observation	The thin persistent blue line makes it hard to distinguish which of the adjacent arrow controls has focus; inspect at native size and with zoom before final SC 2.4.7 classification.
Purchase and Favorite buttons	FAIL — SC 2.4.7 (A11Y-005)	A brief focus ripple disappears while keyboard focus remains; no persistent visible indication identifies the focused button.
Add More navigation	Workflow / UX observation	Adds item and navigates directly to cart. No keyboard-specific failure established; confirm whether behavior matches the intended product journey.
Dynamic Favorite state	Assistive-technology follow-up	View Favorites is correctly next in keyboard focus order; check whether state change is announced by VoiceOver.
Shared commerce navigation	Component consistency check	Five utility controls recur elsewhere in the commerce system; review consistently without duplicating shared component findings.

Positive Keyboard Behaviors Observed

- Breadcrumb links and product navigation arrows are keyboard reachable and activate as expected.
- Quantity supports arrow-key adjustments and direct numeric editing.
- Product text fields are keyboard reachable and operable.
- Favorite dynamically adds View Favorites while preserving a logical next-Tab sequence.
- Commerce utility navigation is reached after social sharing in a predictable order.
- Skip to Main Content bypasses the repeated global navigation.

Conclusion

Within this keyboard-only product-detail sample, primary product controls and navigation were operable. One recurring confirmed finding concerns the off-screen focused Store breadcrumb following skip-link activation (A11Y-003 / SC 2.4.11). Focus indicators on the navigation arrows and purchase/favorite buttons fail SC 2.4.7 because the transient ripple disappears while focus remains. The recurring commerce-button Focus Visible failure is assigned A11Y-005 in the consolidated findings.

Later audit phases: structure and semantics, VoiceOver, automated tools, technical investigation, and full WCAG 2.2 A/AA coverage review.

PART IV

Shopping Cart & Checkout Entry

Editable cart, nine-product states, keyboard-inoperable expander, email and contact-information checkout entry.

SCOTTS VALLEY MARKET

Accessibility Audit - Keyboard Evaluation

Shopping Cart Page - WCAG 2.2 Keyboard Results

Conformance target: WCAG 2.2 Level AA

Methodology: WCAG-EM, manual keyboard evaluation phase

Evaluation environment: macOS, Chrome, keyboard only; VoiceOver off

Prepared by: Erin Van Brunt

Evaluation period: October 2026

Document status
Final keyboard-testing record and targeted WCAG 2.2 A/AA mapping for the Shopping Cart page and the checkout-entry transition. This document is not a complete page or site conformance determination.

Website: Scotts Valley Market - Shopping Cart

https://www.scottsvalleymarket.com/orderonline/cart

Keyboard evaluation coverage

- Editable cart: ordinary and multi-item states
- Cart item navigation, quantity, coupon redemption, and checkout initiation
- Cart expansion and keyboard/mouse comparison
- Checkout-entry contact information and Change Email
- Skip-link behavior and focus visibility

Evaluation Overview

Purpose. This record documents manual keyboard testing of the public Shopping Cart interface, including its nine-item collapsed/expanded presentation and transition to the checkout contact-information step.

Method. Chrome on macOS with keyboard only and VoiceOver off. The initial sweep used Tab without activating controls. Subsequent checks used Enter, Space, arrow keys, text entry, and a targeted mouse comparison to investigate cart expansion. Unmentioned controls were reported by the evaluator to behave as expected.

Scope boundaries. Previously tested shared header, footer, and “Let’s Chat!” widget are not reevaluated. The five-item commerce utility navigation is recorded only in its cart context. Checkout coverage stops at contact-information entry: no completed pickup, payment, or order submission. Automated tools, VoiceOver, and DOM/accessibility-tree review remain future phases.

Keyboard Evaluation Summary

Area	Keyboard result	Key observation
Ordinary cart navigation	Operable in tested scope	Breadcrumbs, thumbnails, product links, quantity, coupon entry, and email were keyboard reachable.
Nine-item cart expansion	FAIL - SC 2.1.1	The “9 items” control receives focus but does not expand with Enter or Space; mouse click reveals all products.
Checkout button	FAIL — SC 2.4.7	Focus ripple disappears while Checkout remains focused; no visible steady-state focus indication.
Checkout entry	Operable in tested scope	Change Email, name, phone, and Continue follow logical Tab order; Continue fails Focus Visible because its ripple disappears.
Skip to Main Content	PASS (tested behavior)	Skip link moves focus into cart content; no off-screen focused control was reported.
Refresh/scroll position	No confirmed WCAG defect	After refresh the page initially appears scrolled down; first Tab brings the Skip to Main Content link into view.

Shopping Cart Main Content

Standard Tab sequence

Following the previously audited site header, the evaluator observed the following sequence in the editable cart state:

- Breadcrumbs: Store → Shopping cart
- Cart product image → remove/X control → product name/link → Qty control
- Redeem coupon link → Continue shopping
- Email field → Checkout button
- Shared commerce utility navigation: Search Products → My Account → Track Orders → Favorites → Shopping Bag
- Persistent Let’s Chat launcher → floating Shopping Bag widget → shared footer

Focus presentation. Most items had a clear visible indicator, including a blue border around the product image, removal control, and item name. The Checkout button did not show a clear outline; a faint ripple-like visual change was observed. The latter fails SC 2.4.7 because the brief ripple disappears while focus remains.

Normal activation and quantity

The current-page Shopping cart breadcrumb produced no navigation. Product image and product name activated with Enter and navigated to the product detail page. The Qty selector was keyboard reachable; after Enter, arrow-key navigation displayed quantity choices for selection. Remove/X, other links, and navigation were reported to work as expected.

Redeem opened a coupon-code input and Apply button using Enter. The evaluator reported other controls to be operable; a detailed post-reveal Tab check of the coupon input and Apply was not separately recorded.

Nine-item Cart: Collapsed and Expanded States

When the cart contained nine distinct product rows, the collapsed presentation displayed five clickable product thumbnails, with "+5" superimposed on the fifth image. The fifth thumbnail still navigated to that particular product detail page on Enter; it did not expand the list.

Following the five thumbnails, Tab reached a visible "9 items" control with a downward caret. The control received keyboard focus, but neither Enter nor Space expanded the cart. Tab moved on to Redeem. A targeted mouse click on "9 items" successfully expanded the presentation to show all nine product rows.

In the editable cart state (before checkout email confirmation), the expanded view provided quantity and removal controls for each product. In the later checkout contact-information state, expansion displayed a read-only order summary with product names, quantities, and prices rather than editing controls. These are distinct workflow states, not evidence of a defect by themselves.

WCAG result. The mouse-accessible expansion cannot be invoked by the keyboard operations tested, confirming a failure of SC 2.1.1 Keyboard (Level A). Users relying on keyboard input cannot reveal the expanded itemized editable cart using this control.

Checkout Entry and Dynamic States

Email step and progression

An email address was entered and Checkout activated. The interface advanced to /orderonline/checkout/address, displaying an email-completed state, Change Email, First and last name, Phone, and Continue. The saved email state persisted on refresh.

Refresh sometimes restored the viewport at a lower page position, with the header initially out of view. Pressing Tab once moved the viewport to the focused Skip to Main Content link, after which traversal proceeded normally. No keyboard focus-visibility failure was confirmed from the refresh behavior.

Contact-information Tab sequence

Within checkout entry, focus moved from the cart-summary area to Change Email, then First and last name, Phone, Continue, and the persistent chat launcher. The five-item commerce utility navigation was no longer present in this step. The Continue button had the same subtle ripple-like focus presentation seen on Checkout; other focus cues appeared satisfactory.

Change Email activated with Enter, returning to the email-entry view while keeping the previously typed address populated. The test stopped before completing further checkout stages or submitting an order.

WCAG 2.2 Keyboard Success Criterion Results

Scope of this mapping. Results below reflect only keyboard-related requirements and states actually exercised during this phase. "Pass (tested scope)" does not imply full-page or site-wide conformance.

Success Criterion	Level	Result	Evidence / rationale
2.1.1 Keyboard	A	**FAIL**	Mouse click expands the nine-item cart; Enter and Space on the keyboard-focused “9 items” control do not.
2.1.2 No Keyboard Trap	A	**PASS (tested scope)**	Tab continued past the cart expander into following cart and checkout controls. No trap was observed.
2.4.1 Bypass Blocks	A	**PASS (tested behavior)**	The skip mechanism bypassed repeated navigation and reached the cart content.
2.4.3 Focus Order	A	**PASS (tested scope)**	Observed cart and checkout-entry Tab sequences followed the relevant controls and newly displayed form fields.
2.4.7 Focus Visible	AA	**FAIL**	Checkout and Continue buttons exhibit a subtle ripple-like focused state with no obvious outline; the ripple disappears while keyboard focus remains, leaving no persistent indication.
2.4.11 Focus Not Obscured (Minimum)	AA	**PASS (tested scope)**	After refresh, Tab brought the skip link into view; no obscured focused control was confirmed in the cart tests.

Confirmed WCAG Findings from Keyboard Testing

A11Y-004 - Expanded shopping cart is not keyboard operable

Status: Confirmed keyboard WCAG failure

Component: Shopping Cart / nine-item expandable product list

WCAG 2.2: SC 2.1.1 Keyboard (Level A)

Reproduction: Populate the cart with more than five product rows; navigate to /orderonline/cart. Tab through five thumbnails to “9 items”; press Enter and Space. The cart does not expand. Click the same control using the mouse: the full cart expands.

Expected behavior: The expand/collapse function should be operable via standard keyboard interaction, with its expanded state communicated appropriately.

Actual behavior: “9 items” can receive keyboard focus but does not respond to tested activation keys, while mouse click operates the expansion.

User impact: Keyboard-only users cannot reveal the complete product list through the collapsed-cart control. In the editable-cart state, this also blocks access through this expansion path to the additional rows’ quantity and removal controls.

Recommended remediation: Implement the expander as a semantic button (or equivalently keyboard-operable control), support Enter and Space, maintain visible focus, expose expanded/collapsed state (for example, aria-expanded when appropriate), and ensure expanded items and their controls enter an understandable keyboard sequence. Retest in editable cart and checkout summary states.

Severity is deliberately not assigned here; apply the audit-wide severity methodology when finalizing findings.

Other Observations Requiring Review

Observation	Disposition	Reason / next step
Checkout / Continue buttons	FAIL — SC 2.4.7 (A11Y-005)	A brief focus ripple disappears while keyboard focus remains; no persistent visible indication identifies the focused button.
“+5” thumbnail overlay	UX / accessible-name review	Looks like a disclosure count but Enter opens a product. Check programmatic label and user expectation.
Coupon input and Apply	Additional keyboard follow-up	Redeem reveals the controls; a separate detailed traversal of newly revealed input/Apply was not recorded.
Refresh positioning	Documented behavior	Viewport starts scrolled lower, but first Tab restores visible skip-link focus. No failure confirmed.
Dynamic cart summary	AT / semantics follow-up	Expandable product count, changes of state and checkout summaries need VoiceOver and accessibility-tree validation.

Positive Keyboard Behaviors Observed

- Skip to Main Content bypassed repeated navigation on this page.
- Product image/name links navigate to the expected detail views.

- Quantity options could be reached with keyboard arrow-key interaction.
- Redeem revealed coupon-code controls on Enter.
- Email-entry checkout transition succeeded, and the entered address was retained after refresh and Change Email.
- Contact-information fields followed a logical focus order; Tab remained usable after refreshing the checkout step.
- The five-item commerce navigation was present in the editable cart and appropriately absent from the later checkout-entry state.

Conclusion

The Shopping Cart evaluation documented broad keyboard access to product links, quantities, coupon access, and the checkout-entry form. Two keyboard WCAG failures were identified: the nine-item cart-expansion control is mouse-operable but not keyboard-operable (A11Y-004, SC 2.1.1, Level A). Checkout and Continue fail SC 2.4.7 because their momentary focus ripple disappears while the buttons remain focused.

This report covers the cart and first checkout contact-information state only. Full WCAG 2.2 Level AA conclusions require later semantic inspection, VoiceOver, automated testing, and the complete success-criterion coverage review.

WCAG References

- Understanding SC 2.4.3 - Focus Order
- Understanding SC 2.4.7 - Focus Visible
- Understanding SC 2.4.11 - Focus Not Obscured (Minimum)

Glossary & Consolidated Finding Index

A11Y — Unique identifier for a documented accessibility finding.

AT — Assistive technology; VoiceOver testing was outside this keyboard-only phase.

Breadcrumb navigation — Hierarchical links such as Store → Salads → Grab & Go Salads.

Commerce utility navigation — Reusable five-link navigation: Search Products, My Account, Track Orders, Favorites and Shopping Bag.

Focus Visible (SC 2.4.7) — A Level AA criterion requiring keyboard focus to be visibly indicated.

Focus Not Obscured (SC 2.4.11) — A Level AA criterion addressing author-created content that entirely hides focused components.

Keyboard (SC 2.1.1) — A Level A criterion requiring functionality to be operable through a keyboard interface, subject to exceptions.

WCAG-EM — Website Accessibility Conformance Evaluation Methodology; used to organize this evaluation.

Consolidated confirmed findings

A11Y-001 Lightbox controls not reliably keyboard operable; focus escapes behind overlay — Home

A11Y-002 Home promotional/coupon image controls lack persistent visible focus — Home

A11Y-003 Skip link leaves next keyboard focus outside visible viewport — Home & Product Detail

A11Y-004 Nine-item cart expander responds to mouse but not keyboard — Shopping Cart

A11Y-005 Transient commerce-button ripple leaves no persistent focus indication — Product Detail, Cart & Checkout Entry

A11Y-005 consolidates the subsequently confirmed Focus Visible behavior; it is not a claim that the controls share a verified technical root cause. Severity remains unassigned until the audit-wide methodology is applied.

Evaluation boundaries and interpretation

Passing assessments apply only to tested controls and states. This record preserves detailed source observations; assistive-technology testing, semantics/DOM review, automated tests and full WCAG 2.2 A/AA criterion coverage remain outside the completed keyboard phase. WCAG Level AA includes all applicable Level A and AA success criteria.
